

CS 4530: Fundamentals of Software Engineering

Module 9.1 Distributed Systems: Goals and Challenges

Jonathan Bell, Adeel Bhutta, Mitch Wand
Khoury College of Computer Sciences

Learning Goals for this Lesson

- At the end of this lesson you should be able to
 - List and define 5 goals of using distributed systems
 - List 4 major challenges of using distributed systems

What is a distributed system?

Model One:
Many servers talking through a network

Model Two:
Many servers and clients talking through a network

Distributed Systems Goals

- Scalability
- Performance
- Latency
- Availability
- Fault Tolerance

Distributed Systems Goals

- **Scalability**
- Performance
- Latency
- Availability
- Fault Tolerance

“the ability of a system, network, or process, to handle a growing amount of work in a capable manner or its ability to be enlarged to accommodate that growth.”

Distributed Systems Allow Horizontal Scaling

- “Vertical” scaling: add more resources to existing server
 - Faster CPUs, more CPU cores, more RAM, more storage
 - Becomes ineffective : Clock speed plateaus; difficult to write applications that utilize 256 CPU cores (adding 2TB RAM to a server *can* often help)
- “Horizontal” scaling: add more servers
 - Rely on “commodity” servers rather than state-of-the-art hardware
 - Allows for dynamic addition of resources as needed by load

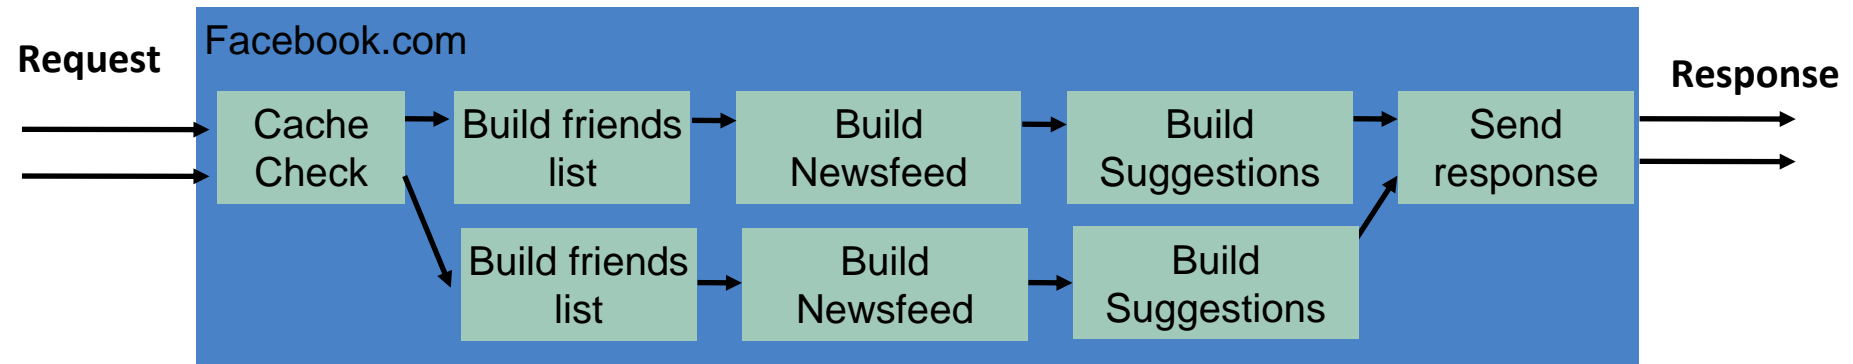

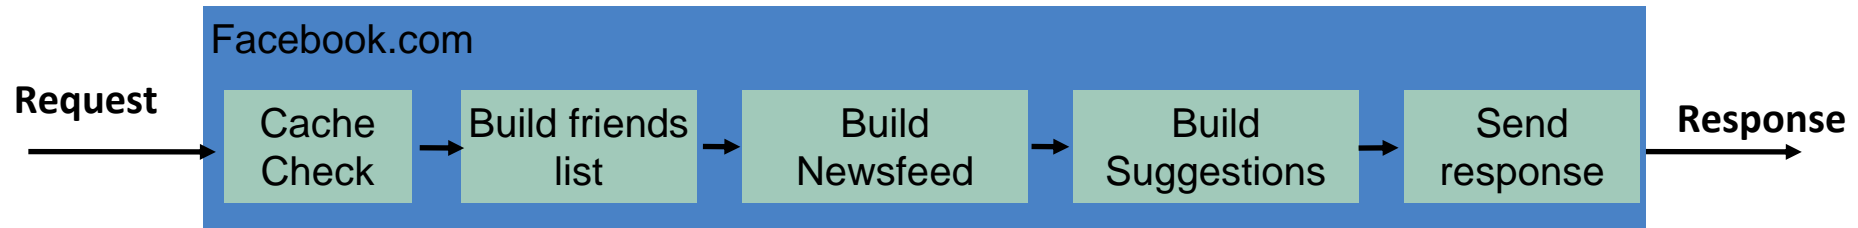

Distributed Systems Goals

- Scalability
- **Performance**
- Latency
- Availability
- Fault Tolerance

“The amount of useful work accomplished by a computer system compared to the time and resources used.”

Multiple Servers Can Improve Throughput With Concurrency

Throughput: total requests that can be processed per unit-time

Distributed Systems Goals

- Scalability
- Performance
- **Latency**
- Availability
- Fault Tolerance

The time during which something that has already happened is concealed from view.

In a multi-server system, we can select a server that is closer to the user.

Reduce latency by distributing data

- Move or replicate the data
 - Avoid bottlenecks
 - Decrease transmission time

Distributed Systems Goals

- Scalability
- Performance
- Latency
- **Availability**
- Fault Tolerance

“the proportion of time a system is in a functioning condition.”

Availability = uptime / (uptime + downtime).

Often measured in “nines”

Availability %	Downtime/year
90%	>1 month
99%	< 4 days
99.9%	< 9 hours
99.99%	<1 hour
99.999%	5 minutes
99.9999%	31 seconds

Distributed Systems can improve availability by replicating servers

- A single-server system is either up or down.
- If you have many servers, the probability that some server is down increases
- BUT: the probability that all servers are down decreases (exponentially!)

Here's a crude quantitative model

- Say there's a 1% chance of having some hardware failure occur to a machine in a given month (power supply burns out, hard disk crashes, etc)
- Now I have 10 machines
 - Probability(at least one fails during the month) = $1 - \text{Probability}(\text{no machine fails}) = 1 - (1 - .01)^{10} = 10\%$
- 100 machines -> 63% chance that at least one fails
- Chance that all machines fail during the month: $(.01)^{10} = 10^{-12}$

Distributed Systems Goals

- Scalability
- Performance
- Latency
- Availability
- **Fault Tolerance**

“ability of a system to behave in a well-defined manner once faults occur”

Design to expect faults

- “Define what faults you expect and then design a system or an algorithm that is tolerant of them. You can't tolerate faults you haven't considered.”

What kind of faults?

Disks fail

Networking fails

Power supplies fail

Security breached

Power goes out

Datacenter goes offline

Distributed Systems Challenges

More machines means more links that might fail.

- Number of nodes + distance between them

Networks introduce delays

- Cannot expect network to be a perfect analog for communication within a single computer because:
 - Speed of light (1 foot/nanosecond)
 - Communication links exist in uncontrolled/hostile environments
 - Communication links may be bandwidth limited (tough to reach even 100MB/sec)
- In contrast to a single computer, where:
 - Distances are measured in mm, not feet
 - Physical concerns can be addressed all at once
 - Bandwidth is plentiful (easily GB/sec)

We still rely on other administrators, who are not infallible

Amazon Web Services outage takes a portion of the internet down with it

Amazon Web Services is currently having an outage, taking a chunk of the internet down with it.

Several AWS services were experiencing problems as of early Wednesday, according to [its status page](#). That means any app, site or service that relies on AWS might also be down, too. (As I found out the hard way this morning when

A screenshot of the AWS website. The top navigation bar includes the AWS logo, links for Products, Solutions, Pricing, Documentation, Learn, Partner Network, AWS Marketplace, Customer Enablement, Events, and Explore More. There are also links for Contact Sales, Support, English, My Account, and a Sign In to the Console button. The main content area is titled "Summary of the Amazon Kinesis Event in the Northern Virginia (US-EAST-1) Region" and dated "November, 25th 2020". The text describes a service disruption that occurred on November 25th, 2020, in the Northern Virginia (US-EAST-1) Region. It explains that Amazon Kinesis enables real-time processing of streaming data and is used by several other AWS services. The event was caused by a relatively small addition of capacity to the service at 2:44 AM PST, finishing at 3:47 AM PST. The text details the impact on the service and the steps taken to resolve the issue, including adding capacity to the front-end fleet and restarting the front-end servers. It also mentions that the new capacity was a suspect, but the root cause was determined to be a full restart of the front-end fleet, which the Kinesis team knew would be a long and careful process. The text concludes by stating that at 9:39 AM PST, the root cause was confirmed, and it was not driven by memory pressure, but rather by the new capacity exceeding the maximum number of threads allowed by an operating system configuration.

Learning Goals for this Lesson

- You should now be able to
 - List and define 5 goals of using distributed systems
 - List 4 major challenges of using distributed systems
